Computer Problem

1. a. Consider a one-dimensional rod that is insulated along its edges. Assume that it has a length of 10 cm. The rod is initially placed so that one end is 0°C and the other end is 100°C. It is allowed to come to a steady-state temperature distribution. Find this temperature distribution, $u_e(x)$.

b. At time t = 0, the one-dimensional rod from Part a is insulated on both ends. This implies that the rod satisfies the PDE:

 $\begin{array}{lll} \displaystyle \frac{\partial u(x,t)}{\partial t} &=& \displaystyle \frac{\partial^2 u(x,t)}{\partial x^2}, \qquad t>0, \quad 0< x<10,\\ \mbox{Boundary Conditions}: && \displaystyle \frac{\partial u(0,t)}{\partial x}=0, \quad \frac{\partial u(L,t)}{\partial x}=0, \quad t>0,\\ \mbox{Initial Conditions}: && \displaystyle u(x,0)=u_e(x), \quad 0< x<L, \end{array}$

where $u_e(x)$ is the steady state temperature distribution from Part a. Find the solution to this problem, including the Fourier coefficients. Create a graphic simulation showing the 3D plot of temperature as a function of t and x, using 5 and 50 terms (Fourier coefficients) to approximate the solution with $t \in [0, 20]$.
